Jobinator: Design

AI Analysis & Assistant

Simplified, easy, and user-friendly

AI-assisted career document support for resumes, CVs, and LinkedIn profiles.

ER Diagram | UI Mockups | Tech Stack | Testing | Feedback

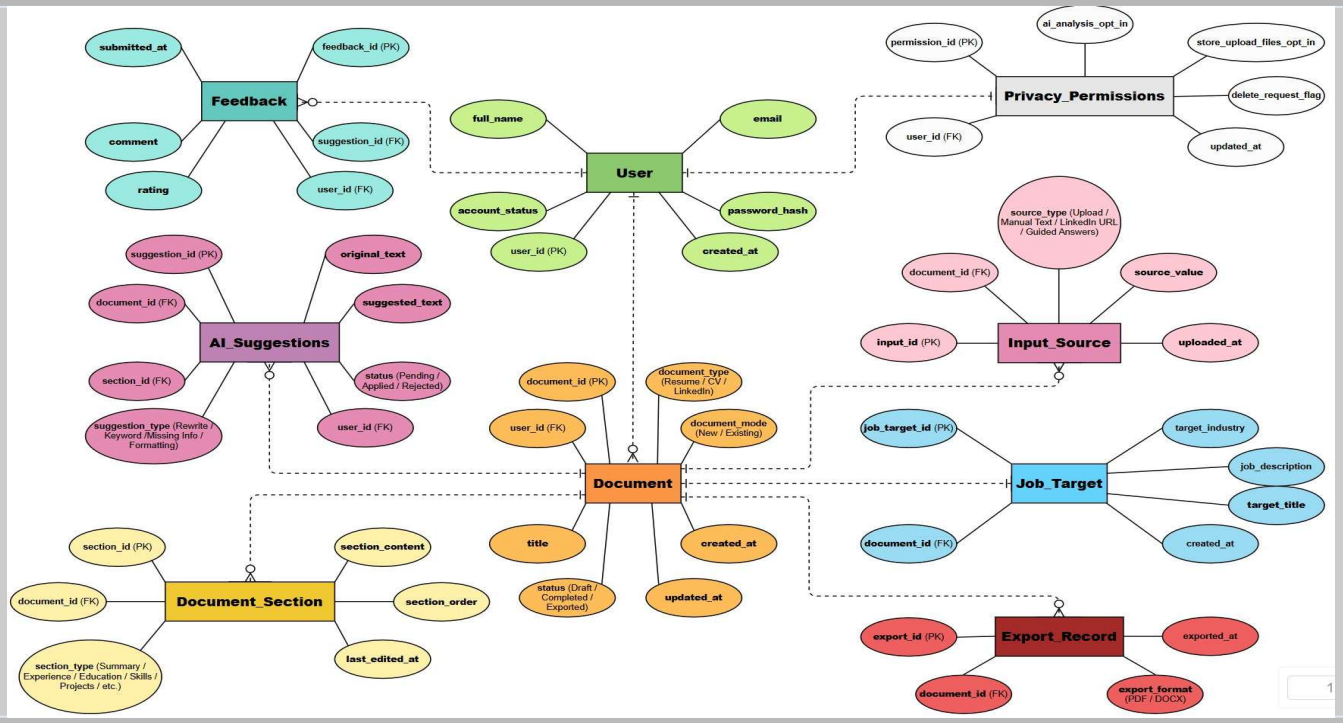

Prepared by: Brian, Ethan, Kevin, Mohammad

Required Deliverables

- ER Diagrams
- UI Mockup Design
- Technology Stack
- Preliminary Testing Plan
- Feedback Collection

ER Diagrams

Database structure for accounts, documents, AI suggestions, permissions, and exports.

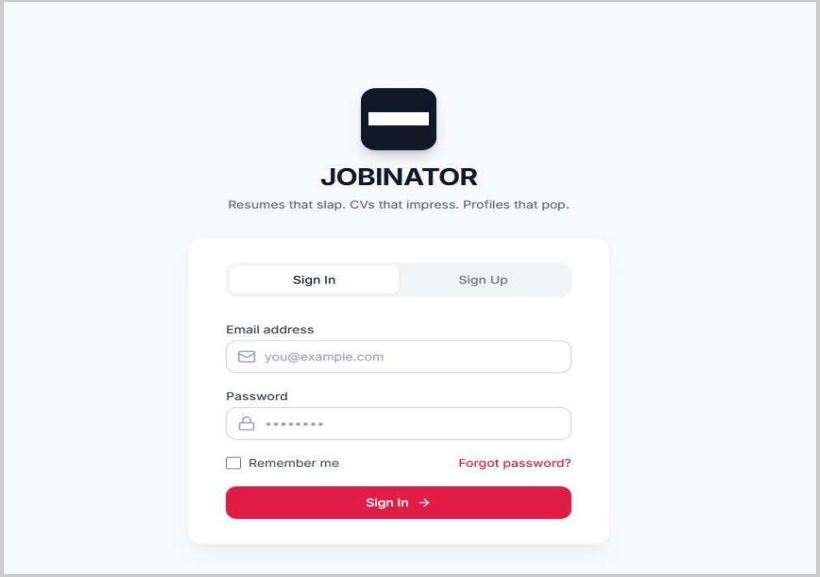

Key idea: The User and Document act as the center of the model, while AI suggestions, job targets, input sources, feedback, permissions, and export records support the full document workflow.

UI Mockup Design

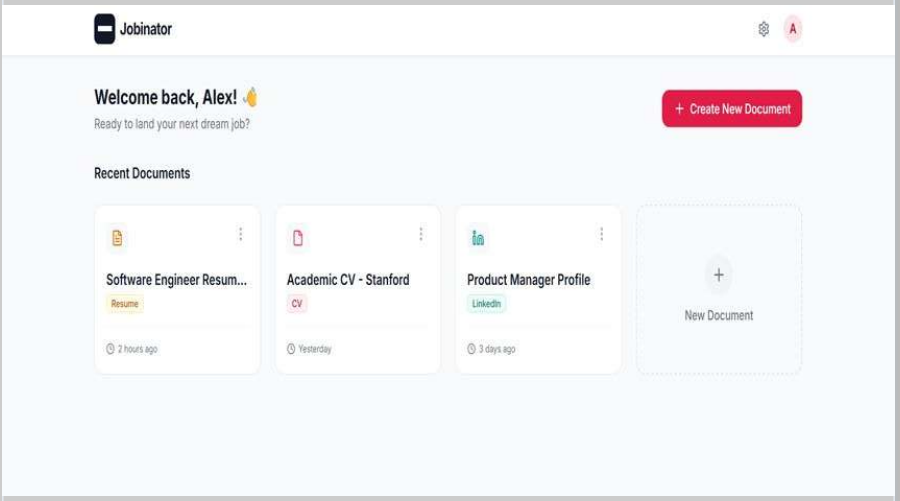

Guided Visual Screens for the application.

Sign-In

Allows users to securely log into Jobinator or create an account to begin working on their career documents.

Dashboard

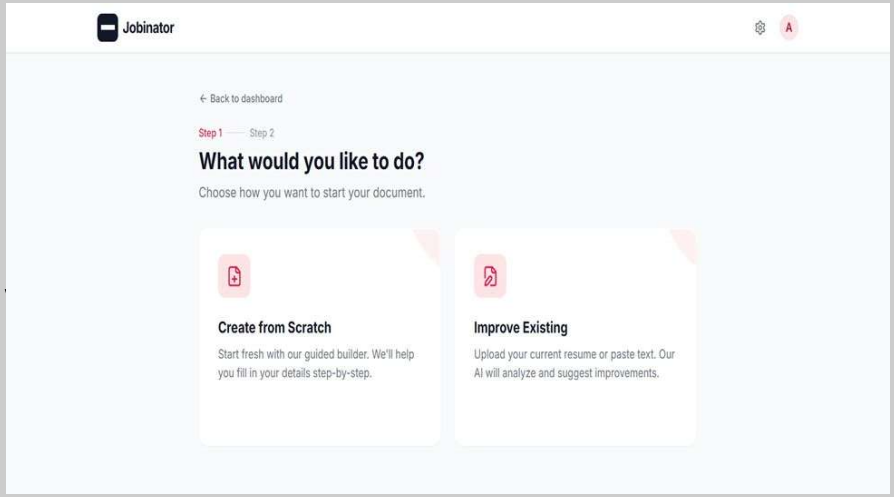

Shows the user's saved drafts and recent documents while providing a quick way to start a new project.

sign in → choose document type → provide content → revise with AI → tailor for a job → export as PDF/DOCX.

UI Mockup Design

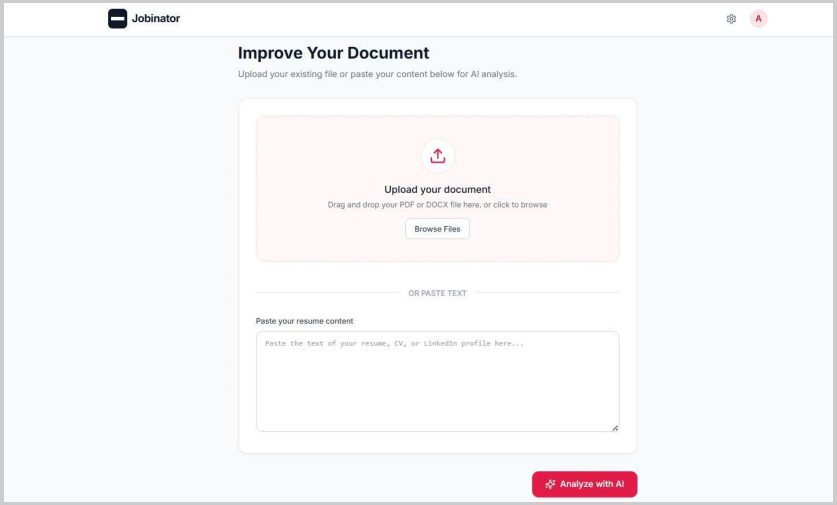

Guided Visual Screens for the application.

Create

Lets users choose whether they want to create a resume, CV, or LinkedIn profile from scratch or improve an existing one.

Input

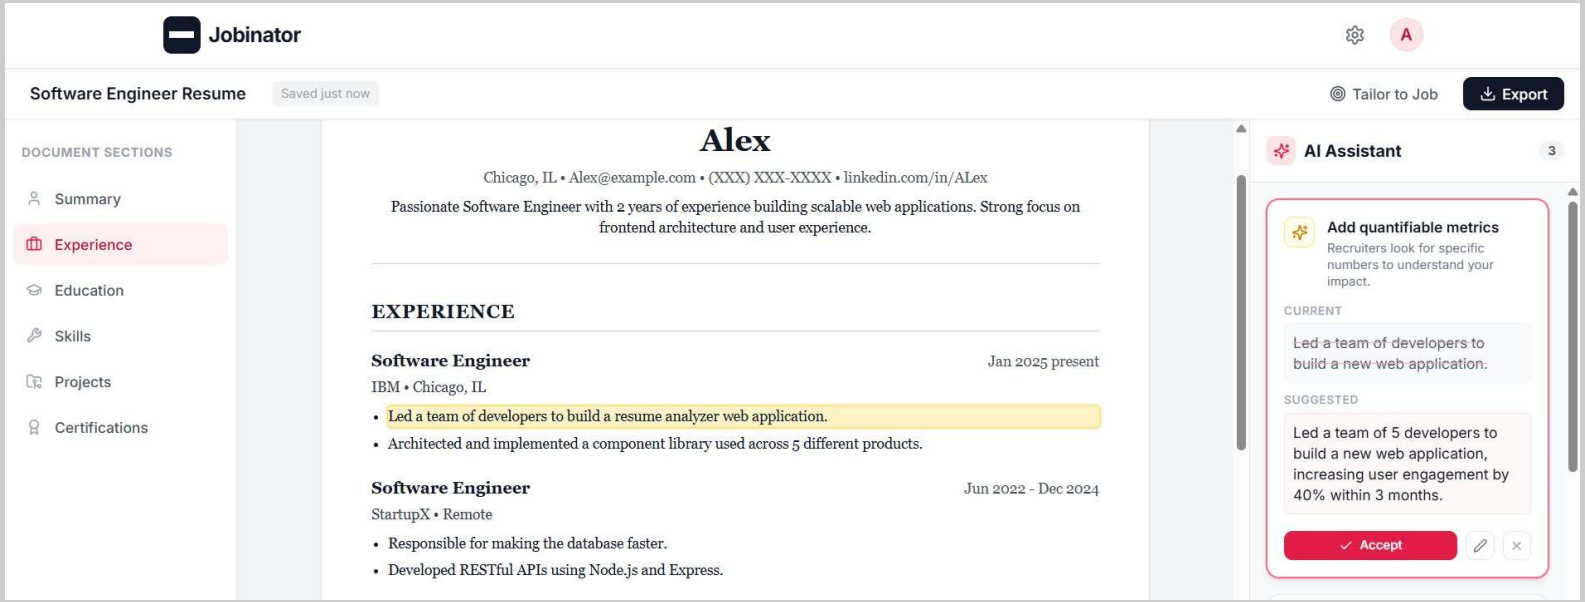

Allows users to upload, paste, or manually enter their career information for AI review and document creation.

sign in → choose document type → provide content → revise with AI → tailor for a job → export as PDF/DOCX.

UI Mockup Design

Guided Visual Screens for the application.

Editor + AI

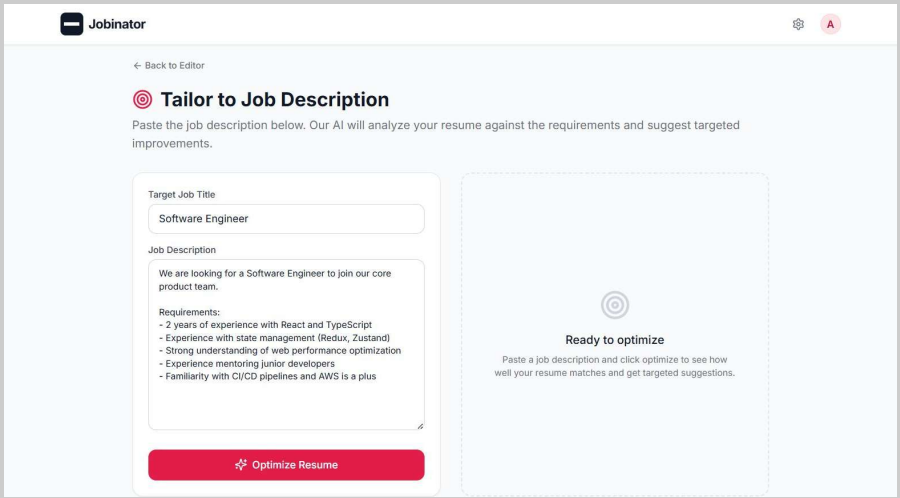

Provides an editable document workspace where users can review AI suggestions, improve wording, and refine weak sections.

sign in → choose document type → provide content → revise with AI → tailor for a job → export as PDF/DOCX.

UI Mockup Design

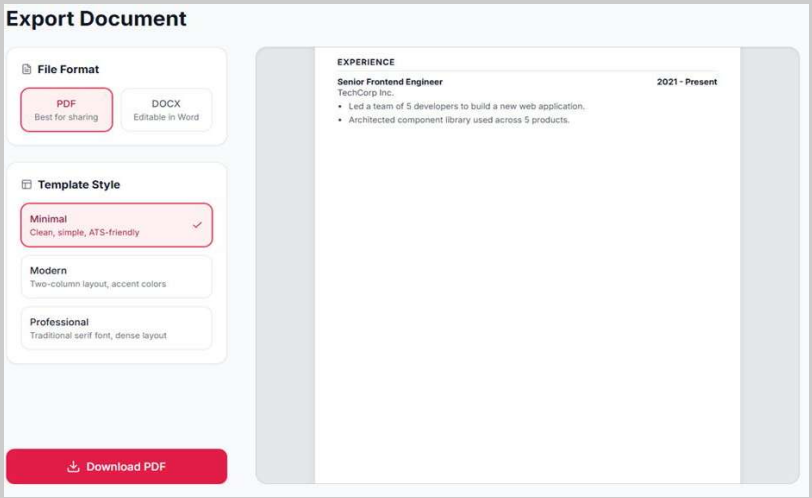

Guided Visual Screens for the application.

Tailor

Helps users adjust their document toward a specific job title, industry, or job description while keeping their real qualifications intact.

Export

Allows users to preview the finished document and download it in a usable format such as PDF or DOCX.

sign in → choose document type → provide content → revise with AI → tailor for a job → export as PDF/DOCX.

Technology Stack

The tech stack for Jobinator, an AI career document platform tailored to the users needs.

Frontend

React.js + TypeScript
Responsive web interface for login, dashboard, editor, tailoring, and export screens.

Backend

Node.js / Express
Handles requests, sessions, document workflows, and AI service routing.

Database & Storage

Structured database + file storage
Stores accounts, drafts, uploaded content, suggestions, permissions, and export records.

AI / NLP Service

External LLM service
Generates, rewrites, improves wording, and tailors content to job descriptions.

Document Processing

PDF/DOCX tools
Supports document parsing, preview, formatting, and final export.

Security

HTTPS/TLS + authentication
Protects accounts, sessions, uploads, admin controls, and document data.

The focus is to keep the platform lightweight, secure, easy to update, and flexible enough for future expansion features.

Preliminary Testing Plan

Regular testing outline for the prototype and future implementation.

1

Unit Testing

Test form validation, authentication helpers, document utilities, and export formatting logic.

2

Integration Testing

Verify the frontend, backend, database/storage, AI service, and export pipeline work together.

3

Usability Testing

Check whether users can create, improve, tailor, save, and export without getting lost.

4

Security Testing

Test login, session handling, upload permissions, privacy settings, and restricted admin access.

5

Performance Testing

Measure loading, saving, AI generation, upload, and export response times under normal use.

6

Accessibility/Performance Testing

Run tests with 32,000+ concurrent users, while the response time is below 2 to 3 seconds.

A goal to have is to make the workflow stable, understandable, and safe before adding any heavier features down the line.

Feedback Collection

Questions for classmates, stakeholders, and test users.

Design & Navigation

- Is the layout easy to follow?
- Where did the workflow feel confusing?
- Are buttons and labels clear?

AI Suggestions

- Are rewritten sections useful?
- Do suggestions stay truthful?
- Is the user clearly in control?

Document Workflow

- Can users complete create/improve/export?
- Does tailoring feel helpful?
- Are PDF/DOCX options clear?

Privacy & Trust

- Are permission controls understandable?
- Does the system ask before storing or analyzing files?
- Is deletion/recovery clear enough?

Performance & Errors

- Did anything load too slowly?
- Were error messages helpful?
- Could users retry without losing work?

Overall Satisfaction

- Would users rely on this for a real resume/CV?
- What feature matters most?
- What should be improved first?

Feedback method: prototype walkthrough + short survey + open comments after users try the main workflow.
